Discharge advice following radical vulvectomy and bilateral groin node dissection

The surgery you have had is a ........................................................................................................

This is removal of ......................................................................................................................

..............................................................................................................................................

Before leaving the ward

Make sure

- Follow up appointment

- You have been given the opportunity to ask your nurse any questions

You may be asked to sit in the dayroom before going home to allow emergency or new admissions for surgery that day to be allocated a bed. This will only be done if absolutely necessary.

This advice is intended as a general guide. Everyone is different. You may also receive additional information to aid your individual recovery. Please ask for any additional advice or written information which you may feel will help.

After two weeks you can gradually start to do more and by six weeks most women are back to their normal levels of activity with the exception of heavy or prolonged lifting or strenuous sports. Listen to your own body and use your common sense but do not push yourself too hard.

If you are travelling a long distance home take a break in your journey, get out of the car and stretch your legs. It is important to maintain your fluid intake on the way home, we suggest that when you stop you have a glass of water or a cup of tea to help keep you hydrated.

Rest and exercise

Get dressed each day and go for a short walk, gradually increasing the length each day and continue to do the exercises taught by the physiotherapist.

You should avoid excessive pushing, pulling or stretching. You should avoid heavy housework such as vacuuming, ironing; mopping floors etc, for up to 12 weeks after your operation (do not carry more than a three pint kettle) therefore accept help from others when it is offered. You can do light household duties such as dusting and making a cup of tea. Allow children to climb onto your lap whilst you are already sitting rather than lifting them up.

You will continue to feel tired so continue to rest when you can and gradually increase the amount of exercise you do. Some exercise is important because sitting for long periods can cause ankle and foot swelling and can increase your risk of deep vein thrombosis.

Walking is an excellent example of exercise. Gradually increase the length of your walks but only walk a distance you are comfortable with. You should avoid high impact exercise (e.g.,

Page 1 of 6
gym, jogging, aerobics) for 3 months. You may swim after six to eight weeks when your vaginal bleeding has stopped and your wound has fully healed.

Diet

Try to eat a healthy balanced variety of foods with plenty of fresh fruit and vegetables. Introducing high fibre food including wholemeal bread, bran flakes, beans and pulses along with plenty of fluids will help prevent constipation. You should drink at least eight glasses of water (or non sugary drinks) every day. Protein rich foods including fish, eggs, meat, hearty green vegetable and beans and pulses will help with the healing process.

Avoid fatty foods, excessive alcohol, cakes and sweets if you do not want to gain weight. Your operation won’t make you put on weight but you must control your calorie intake whilst you are less active.

Some women have a poor appetite following surgery which can be for many reasons. If this applies to you please consult your GP who can refer you to a dietician or prescribe supplements.

Constipation

Pain killers, reduced activity, having an operation and changes in your appetite can all affect your bowel function. If you are constipated following your discharge from hospital it is important that you try to address it before it becomes a problem. Try to increase your fluid intake and eat a well balanced diet with foods rich in fibre ie. wholemeal bread, bran flakes, beans and pulses.

If you have not moved your bowels for three days, please contact your GP or district nurse who may give you some medication to help.

Driving

It is acceptable to go anywhere as a passenger in a car but if you are going long distances ensure you stretch your legs regularly.

It is important to consider the safety of yourself and others. From a surgical point of view we recommend you don’t drive for at least six weeks after your operation. You can start driving again after this only when you:

- Are able to fully concentrate,
- Have stopped medication that may affect your driving ability
- Feel comfortable doing an emergency stop
- Have checked with your insurance company that you have insurance cover.
Wound care/ hygiene

If you have clips/staples in your vulva and or groins, these will be removed on day seven following your operation. Sometimes the sutures we use are dissolvable but if they do not dissolve we may arrange for them to be removed. Your district nurse will assess your wounds when you are at home. Your ward nurse will refer you to the district nurse if you need any follow up (eg, wound dressing, to remove remaining sutures).

It is important to continue bathing or showering daily to prevent infection. It is safe to get your wound wet unless otherwise advised. Clean your wound with unperfumed soap and water, (there is no evidence to support adding salt to your bath water and this may well just dry your skin). Avoid using antiseptic or bubble bath until your wound has fully healed. After bathing or showering pat dry your wound with a clean dry towel. Do not apply any creams or ointments to the wound site.

Your wounds will go through stages of healing. It is normal to feel tingling, itching and/or numbness. It may feel lumpy as new tissue forms and you may experience some pulling as it heals.

If your wound is closed and clean leave it uncovered to aid healing and avoid tight fit clothing.

Lymphoedema

You may develop swelling in the legs or in the groin area (lymphoedema). You have a risk of developing a fluid collection where the lymph glands were removed from the groins. This is called a lymphocyst. This may resolve on its own with time, however sometimes it may be necessary to drain these collections. We try to avoid draining these as there is the risk that they will come back and also there is a risk of infection.

It is important if you do experience swelling or redness in the vulva or groin area after discharge from hospital that you contact either your GP or the team incase you have developed an infection.

Feelings

Your operation has been a stressful event both physically and emotionally. It is normal to feel initially tired which in most instances will gradually get better over the weeks. Most women say they start feeling their “normal” selves after three to six months. During this time you may feel angry and frustrated not being able to do the things you want to do.

It is sometimes difficult for family/friends to understand how you are feeling. Your partner may have his own worries about the effect of the operation. It is important for both of you to talk about your feelings concerning this operation and seek help and support from elsewhere if necessary.

Fatigue

You may feel like you have no energy and find it difficult to do simple everyday things that we usually take for granted. This is very common during cancer and its treatment including
surgery and may leave you feeling frustrated and overwhelmed. Fatigue following surgery (where women feel tired and need to take things easy) is usually temporary. Diet, exercise, relaxation, planning and support can all contribute to easing fatigue.

Your sleeping patterns may change due to a change in routine. Sleeping patterns will return to normal and strength and stamina will return.

**Sexuality and relationships**

Your operation can have an effect on your sexuality and relationships.

Having a radical vulvectomy can impact on having a physical relationship and make penetrative intercourse difficult. This may be due to the wound healing or the extensive excision which is necessary to remove the cancer.

It is important that you have the opportunity to discuss with your consultant the full implications of having surgery on your sexual functioning. If you feel unable to raise this with your doctor, please ask to speak to one of the nurse specialists.

If you have any sexual issues you or your partner want to discuss our psychosexual service is led by our nurse consultant. To arrange an appointment contact our Nurse Consultant on 0191 445 6148.

**Medications**

You will normally have Medications including pain medicine, laxatives and anti sickness medication prescribed before you leave the hospital. Use the medication as directed. If you are taking pain medicine such as morphine or sleeping pills, do not drink any alcohol, drink plenty of fluids to help prevent constipation and do not drive. Contact your GP with any side effects from your medication.

**Returning to work**

You may have symptoms such as tiredness or pain which may affect your ability to work as a result of your treatment. It is not unusual to take time off work to adjust to your diagnosis as the emotions may make it difficult to concentrate at work effectively. Most employers will be sympathetic to this and your doctor can sign you off from work if needed. It may be helpful to talk to your employer, occupational health or human resource staff for advice and support.

You are the best judge of when you feel ready to go back to work as some jobs are more strenuous than others and recovery rates vary from woman to woman. It is advisable to take a **minimum of six weeks** off work. Discuss with your doctor at your six week post operative follow up about returning to work.

Macmillan cancer relief can provide booklets on returning to work and this can be found on the macmillan web site [www.macmillan.org.uk](http://www.macmillan.org.uk) or by telephoning 0800 500 800.
When to call your doctor

Seek medical attention if any of the following occur:

- Severe pain not controlled by pain killers
- Fever, shaking or chills or other signs of fever
- Signs of wound infection including increased redness, swelling, tenderness, warmth or drainage from the wound
- Offensive smelling discharge
- Excess bleeding
- Persistent vomiting with the inability to tolerate food and fluids
- Constipation for more than three days
- Severe pain in either calf or leg or sudden onset shortness of breath or chest pain
- Problems passing urine and/or urinary problems

Useful resources

If you have any concerns or anxieties when you go home, telephone ward 14a at the Queen Elizabeth Hospital Telephone 0191 445 2013.

Specialist Nurses Monday – Friday 08.30 – 17.00 on 0191 4452123 or 0191 4453404

Cancer backup and Macmillan support joined together in 2008. Their aim is to provide information and support for patients affected by cancer. If you need further information or support you can contact them by their website, www.macmillan.org.uk or by telephone 0800 500 800.

Your occupational health department at work may also be able to provide help and support with your return to work. Please check with your employer.
